Title: Distributed Listening with Mobile Phones

The concept is building a system for distributed listening with mobile phones. Audience members enter a room and scan a QR code. This loads a web app into their phone's browser. They place the phone on the floor or a table. Over the following minutes, the phones play back a sound piece or design in assigned groups or individually. The composers/designers determine the sound sources, their timing, position of the phones, and the grouping of phones.

Of course, there are some previous implementations on this. For example:

<https://www.insomniac.com/magazine/sparses-phone-orchestra-creates-symphonies-among-strangers/>

massMobile by Jason Freeman and others
(https://www.nime.org/proceedings/2012/nime2012_128.pdf)

Beatsync by Jason Freeman (<https://github.com/freeman-jiang/beatsync>)

I plan to use this for the CART 346 Digital Sound class.
